

Multi Directional Forklift

Used Side Loader Forklift Tempe - Side loader forklifts are ideal for lifting long and heavy materials in narrow locations such as warehouse aisles, loading docks, lumber yards, etc. These machines have derived their name from the way they unload, load and transport material. Benefits of Side Loader Forklifts v Standard Forklifts Forklifts which operate on the standard counterbalance system may become unstable when loading, transporting or unloading heavy, long loads. The side loader forklift can tackle these awkward loads including timber and extensive pipes with greater stability. Long loads such as timber, steel or pipes are more easily handled because the load is facing in the direction being traveled, reducing the overall width of the equipment and load. They also offer the advantage of providing the driver of the forklift with an unobstructed view, which is otherwise at least somewhat or greatly impeded by the tines and load carried at the front on a standard forklift. Since the loads are transported along the side of the forklift instead of across the front, the side loader can travel easier through narrow aisles and doorways. The load may have to be lowered or raised to get past obstacles that can increase the chances of destabilizing and cause dangerous tip-overs. Side loaders eliminate the need for much of that maneuvering. Operating in narrow warehouse locations is much safer and more accurate with side loaders. Many models can lift up to 12K lbs. while traveling at speeds higher than 5 miles an hour. There may be the ability to have travel speeds programmed. This design enables operators to match speed to a certain job. Types of Side Loader Forklifts Class 2 - Electric Motor Narrow Aisle Trucks Side loader forklifts often fall under the Class 2 - Electric Motor Narrow Aisle Trucks classification. This classification, as the title description suggests, encompasses forklifts that operate in narrow aisles and are powered by an electrical source. Excellent for operating in loading docks and warehouses, these units rely on narrow aisle configuration and are moved between close quarters common for storing lumber, bar stock, laminate and carpet. These machines are used for feeding machine tools and rack storage. The narrow aisle units are popular in warehouses as they offer a sleek design that saves on storage. These units are efficient at loading and unloading. These Class 2 side loader forklifts are designed to minimize the area taken up by the forklift truck. This allows increased efficiency and speed when moving, loading and unloading in narrow aisles. Electric power reduces harmful emissions and allows these machines to be used mainly inside. Internal Combustion Engine Side Loader Forklifts Side loaders that are not powered by electricity obviously do not fall under the Class 2 forklift classification. The side loader design is popular for outdoor use as well in places such as timber and lumber yards, steel and pipe producers and many other similar job sites that require long, heavy loads to be transported to and from storage areas, such as racking, or stacking loads in blocks, or offloading from flatbeds. Exterior side loaders need to work outside and on uneven surfaces. This means an internal combustion engine and, sometimes, pneumatic tires are a better option for the job. Side loaders are especially popular for these types of applications because the weight and length of materials being handled mean that the side loader forklift can maneuver between narrow stacks, piles or aisles to pick up the long load in their middle which is crucial for loading long items and safely transporting them. Side Loader Forklift Design The side loader forklift has two kinds of designs, sit down models or stand on models. Stand On Side Loader Forklifts Used mostly indoors in applications such as warehouses, the stand on end control has a small platform area surrounded by the forklift's controls, usually located in the middle of the truck, for the operator to stand. There are several advantages to this design. The stand on side loader does not require a seat for the operator which allows for a smaller cab design. This means the forklift has a smaller footprint which is an advantage when maneuvering around tight, high-traffic areas. Especially while operating in reverse, there is greater operator visibility from a standing position. Operators have a better view while standing and reversing compared to having to twist their body, back and neck to see as with a sit-down unit. There are more safety and operator comfort in the stand-up side loaders, ensuring better visibility and less potential for damage or injury. Finally, the operator

in a stand on forklift is able to enter and exit the cab quicker than a sit down forklift which can increase workplace efficiency in some applications.

Sit Down Side Loader Forklifts

The sit-down side loader is more popular than standing loaders. Sit-down side loaders have a cab that is situated in the center of the machine. Sit-down forklifts have a raised platform and a seat that faces the control panel of the machine. Operator comfort is one of the main advantages of the sit-down side loader. The machine enhances productivity and reduces fatigue when operators can work from a resting position.

Customizable Features

Customizable bed lengths are a feature and benefit of side loader forklifts. Custom applications can be met on the job with a sixty-inch extension to further the reach of standard bed length side loaders. A side loader cannot be customized before bed length considerations are given to ensure that guide rails and aisle widths can accommodate. One popular feature for these forklifts is multidirectional capability. These side loaders have crab steering which allows two wheels to operate independently from the others. Crab steering allows the unit to travel in all four directions by changing the direction of the wheels. The side loader can fit into close quarters and narrow spaces without needing to make huge turns or adjustments. The smaller turning radius helps to avoid damage to items and the building while increasing safety. More efficiency is attained since there are less space and time needed to move around the job site. Several other features on side loader forklifts are often customized based on jobsite application. Customizable options include lift capacities, lift mast heights, tine length, mirrors, lights and more. Certain features are also adjustable, allowing for further customization of the side loader for the particular job application. Travel speed, acceleration time, load limits and breaking force can all be set allowing further job efficiency and increased workplace safety. For all of the above reason, the side loader forklift has become the most popular option for workplaces where space is limited and long loads are involved.
